

**Communities across the country and around the world require safe drinking water and properly treated wastewater to grow and thrive. Limited budgets are driving the need to productively manage and secure these resources as populations grow. Technology, specifically the ability to remotely manage lift stations, pumps, valves and pipelines, are key to efficient management.**

Traditional technologies including SCADA are being supplemented with point to multi-point wireless back haul, extensive network monitoring and cameras to protect these assets and the populations they serve.

KNS is consistently analyzing new technologies and options for our water utility customers so they can take advantage of improved security, efficient management and reliable wireless communications.

Contact us through [sales@knsdenver.com](mailto:sales@knsdenver.com) for more information about new technologies.
